

4:1 Differential Multiplexer

The MC10/100EL57 is a fully differential 4:1 multiplexer. By leaving the SEL1 line open (pulled LOW via the input pulldown resistors) the device can also be used as a differential 2:1 multiplexer with SEL0 input selecting between D0 and D1. The fully differential architecture of the EL57 makes it ideal for use in low skew applications such as clock distribution.

The SEL1 is the most significant select line. The binary number applied to the select inputs will select the same numbered data input (i.e., 00 selects D0).

Multiple V_{BB} outputs are provided for single-ended or AC coupled interfaces. In these scenarios, the V_{BB} output should be connected to the data bar inputs and bypassed via a 0.01 μ F capacitor to ground. Note that the V_{BB} output can source/sink up to 0.5mA of current without upsetting the voltage level.

- Useful as Either 4:1 or 2:1 Multiplexer
- V_{BB} Output for Single-Ended Operation
- 75k Ω Internal Input Pulldown Resistors
- >1000V ESD Protection

1. Absolute maximum rating, beyond which, device life may be impaired, unless otherwise specified on an individual data sheet.

2. Parametric values specified at: 10EL Series: -4.94V to -5.50V
100EL Series: -4.20V to -5.50V

1. 10EL circuits are designed to meet the DC specifications shown in the table after thermal equilibrium has been established. The circuit is in a test socket or mounted on a printed circuit board and transverse airflow greater than 500lfpmin is maintained. Outputs are terminated through a 50Ω resistor to -2.0V except where otherwise specified on the individual data sheets.

1. This table replaces the three tables traditionally seen in ECL 100K data books. The same DC parameter values at $V_{EE} = -4.5V$ now apply across the full V_{EE} range of -4.2V to -5.5V. Outputs are terminated through a 50Ω resistor to -2.0V except where otherwise specified on the individual data sheets.
